

MOBILE SURVEILLANCE UNIT (MSU)

Keep watch over your job site and property at all times.

At GardaWorld, we understand that deterrence plays a key role when it comes to protecting your assets. Fitted with analytical cameras, our Mobile Surveillance Unit (MSU) encourages perpetrators to move on to another target. With direct connectivity to GardaWorld's monitoring station, you can expect immediate action and response to abnormal behaviour on your site.

Precision cameras: The fixed and adjustable cameras are resistant to harsh environments. They provide a detailed 360-degree view and record unusual activity.

Powerful video analytics: Using metadata, the software makes it easier for your security team to do their job and prevent damage before it happens.

24/7 surveillance: Our MSUs are monitored by GardaWorld's professional monitoring centre, to ensure rapid intervention by our specially trained personnel.

A connected app: The client software provides visual remote access in real time, and allows you to view action sequences taken before an alarm. Email or text alerts help you prevent or reduce the cost of potential damage.

Uninterrupted access: The system uses cellular communication to connect to the monitoring centre, via a secure link, allowing uninterrupted access to real-time streaming video and video stored in the cloud.

Rapid deployment: The MSU can be installed in just a few hours.

Power supply options: Our units are equipped with solar panels and rechargeable batteries. They can be self-powered in periods of intense direct sunlight. Solar power not an option? MSUs require a 120V energy source.

Video analytics: Intelligent surveillance

The video captured from the MSU is analyzed in real time by robust software that interprets the images and triggers alerts when suspicious events occur, all while avoiding false alarms. Here are some of the advanced features available:

Object and scene detection

Identify thousands of objects, including vehicles. You can also detect scenes within an image, such as a digging site. This makes it easy for you to add features that search, filter, and curate large image libraries.

Event search

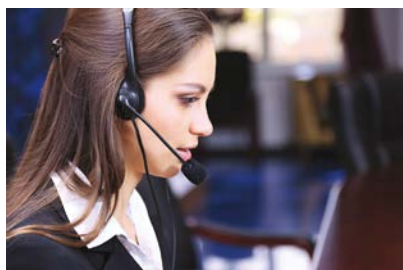

Quickly search through past events within a specific camera view angle. Save time by adding analytical tags to the search and selecting a period of time to pinpoint exact events efficiently.

Heatmaps

In order to identify outdoor high-traffic areas, you can generate smart and accurate heatmaps based on the movement of people and cars.

Other features

During site analysis, our experts will provide you with the optimal system design to enhance your security measures. Some setups can allow for license plate recognition and the creation of time-lapse videos. Need something smaller scale? Our MSU Mini could be a perfect fit for you.

GardaWorld Monitoring: Professional video surveillance

By ensuring that the authorities intervene quickly in the event of an incident, our professional monitoring services make it possible to limit, or even prevent damage due to criminal activities. Our monitoring centre is equipped with state-of-the-art, **ULC-approved technology** that meets the highest industry standards for response time and false alarm reduction. As soon as an alarm is validated, our operators follow your call list protocol and notify the authorities as needed.

The GardaWorld difference

GardaWorld is the largest private security services company offering comprehensive security and risk management services. We protect our clients' people and assets, wherever they are in the world.
